Introduction

Tour Management Project is a dynamic website for the tourism business. It is a dynamic and responsive web design. It is also called a travel technology solution for agencies & tour operations. Nearly everyone goes on vacation for this a tour management project would play a vital role in planning the perfect trip. The tour management project allows the user of the project to access all the details such as weather, location, events, etc. The main purpose is to help tourism companies to customers and hotels etc. The project can also be used for both professional and business trips. The proposed project maintains a centralized repository to make necessary travel arrangements and to retrieve information easily. visitors, analyzing trends, target marketing, and CRM. Indus a Global has introduced a software project for this purpose, called solution provides customers with consulting services such as Forms and Survey Design, Process Design and Re-engineering, and Workflow Optimization. The same software development corporation has produced a semi-intelligent project, called the Visit Trends. The Visit Trends solution provides decision-makers with the ability to slice and dice data, analyze trends, and profile visitors demographically and psycho-graphically. Visit Trends is using machine learning and data mining techniques to guide tourists.

I. REQUIREMENT ANALYSIS

Scope

Tour Management Project is an integrated software developed for tour operating companies. The main aim of this project is to help the tourism companies to manage their customers, vehicles, and agents. It makes all

operations of the tour companies easy and accurate. This platform makes tourism management easy by handling agencies' requests & providing servers for the customers located in different parts of the various cities and states. Different modules have been incorporated into this project to handle different parts and sectors of the tour management field.

Objective

The Tour Management project is a web-based application and maintains a centralized repository of all related information. The objective of this project is to develop a project that automates the process and activities of travel agencies and customer details. The purpose is to design a project using which can perform all operations related to traveling and sight-seeing.

Project Outcomes

There are some objectives and outcomes has each project. So, my project has some outcomes and objectives. These objectives are given below briefly.

- This Project will provide to connect directly Customers and agents through the internet.
- This Project provides facilities to modify and delete tourist's data as well as client data.
- This Project provides some social media links.
- This Project provides information about our country's tour packages.
- This Project maintains and controls the database of tourism's information.
- This Project also provides the 95% correct estimate of your tour regarding time and cost.
- This Project displays attractive tourist places.
- This Project will provide display platform where a tourist can find their tour places according to their choice.
- This Project also helps to develop tourism with different cultures so that they enrich the tourist experience and build pride.

Finally, I can say that this project will provide easy and efficient work for the agency

Limitations of the project

The present projects are inadequate in providing information and advice to the customers about tour plans. Often agencies are compelled to rely on local information sources and count on their own experience regarding

time and cost. Through phone calls they get information. These are some problems which are existing in my project those are given below: -

- There will be many users visiting the portal and hence we require a strong and reliable frontend that can withhold the users on our site.
- we need a strong database whereas data will be the store of everyone.

||. ANALYSIS PHASE

Requirements

The Tour Management Project is a web-based application. The main purpose of the “Tour Management Project” is to provide a convenient and easy way for customers to fulfill their requirements related to tour purposes. Requirements are:-

1. Operating System-windows
 2. Runtime Environment- Angular 8
 3. Front End- HTML, CSS, BOOTSTRAP, JAVASCRIPT, NODE JS, TYPESCRIPT
 4. Back End- MONGO DB
 5. Editor- VISUAL STUDIO CODE, ATOM
- Web Browser- GOOGLE CHROME

Project Develop Languages

There are two kinds of languages have used in the “Tour Management Project”. One is Programing Language and the Other is Database language. Front End, I have Used HTML, CSS, BOOTSTRAP, JAVASCRIPT, NODE JS, TYPESCRIPT & Back End, I have used MONGO DB

Programing Language & Mark-up Language: HTML, JAVASCRIPT
Designing and Colour Script Language: CSS, BOOTSTRAP
Database Language: MONGO DB

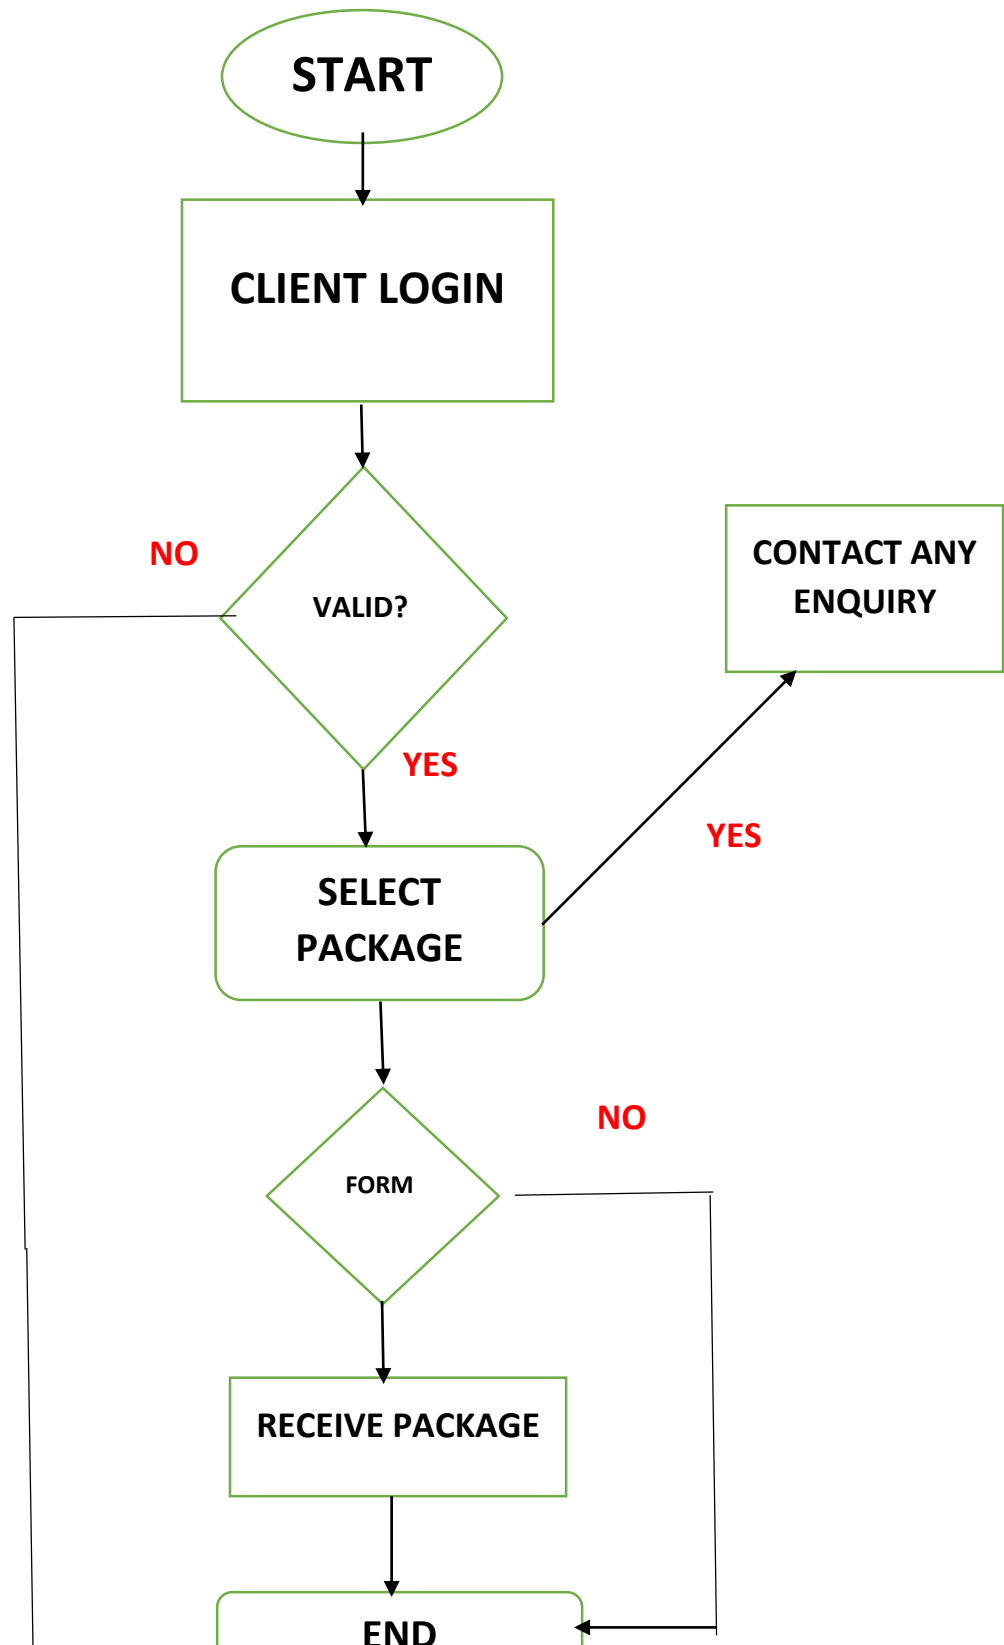

We start our making project with our team members in the guidance of our teacher Mr. Sanjay Rathore

```

Day13 to Day16

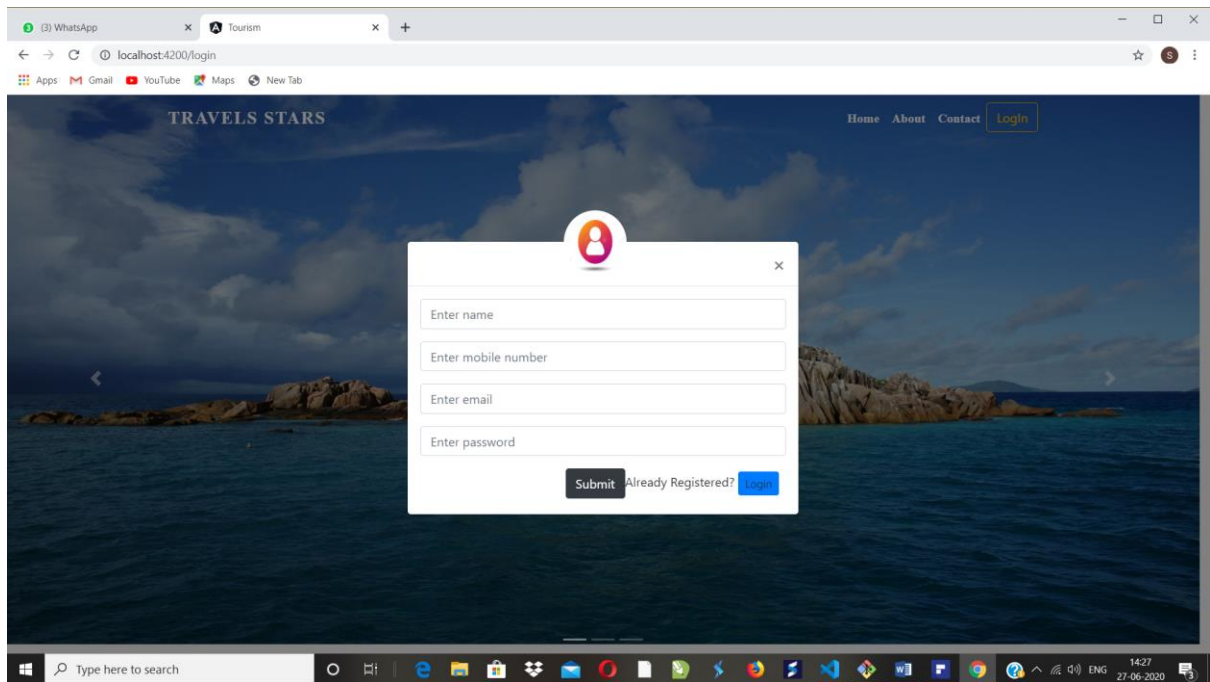

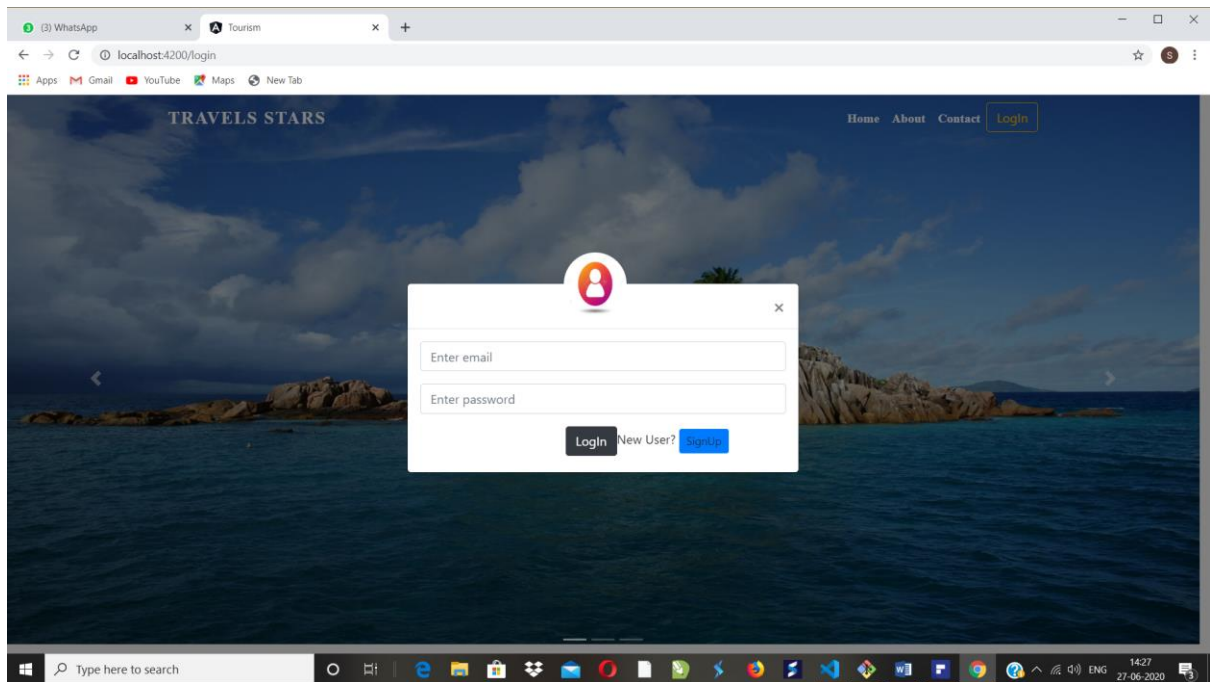

V. TESTING PHASE

Home page:

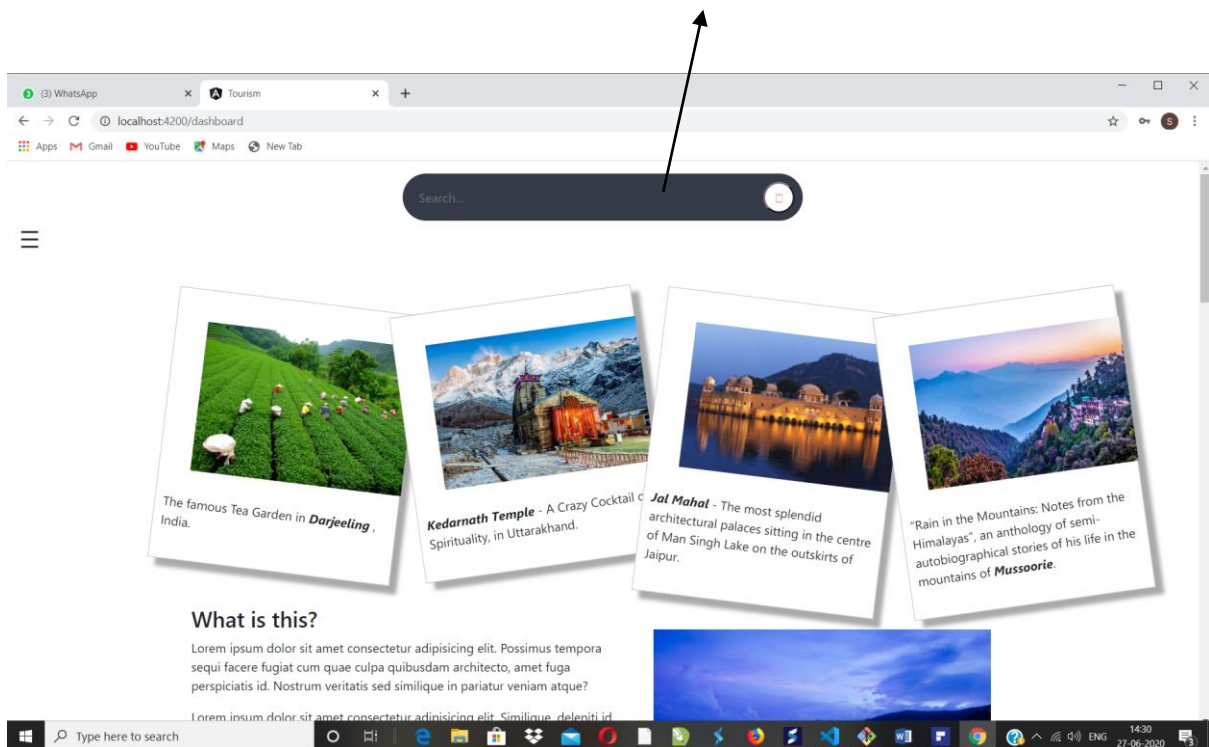

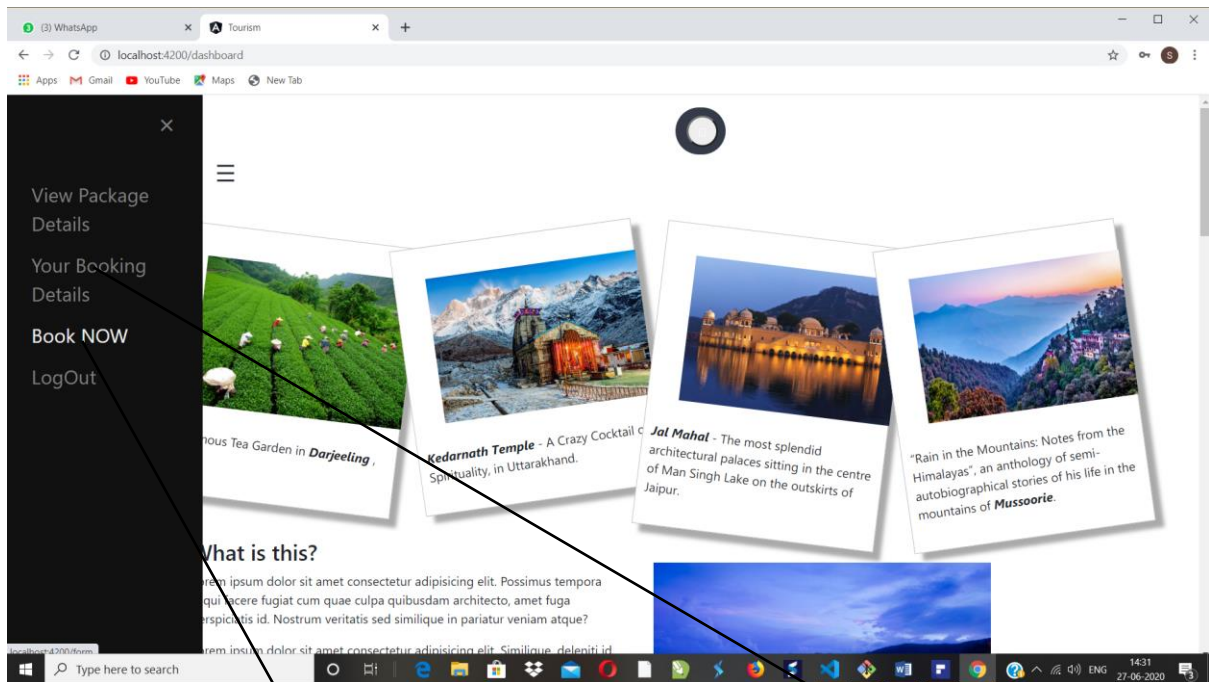

Package page:

User can search place where they want to go

option for user to see their booking details

Option to redirect into detail form

Now user select the package and fill the form

Details Form:

ENTER TOUR/RE NUMBER

No. Of Adults:
no. of adults

No. Of Children:
no. of children

From Date:
dd-mm-yyyy

To Date:
dd-mm-yyyy

Total Package Amount
amount

Description:
Requirements...

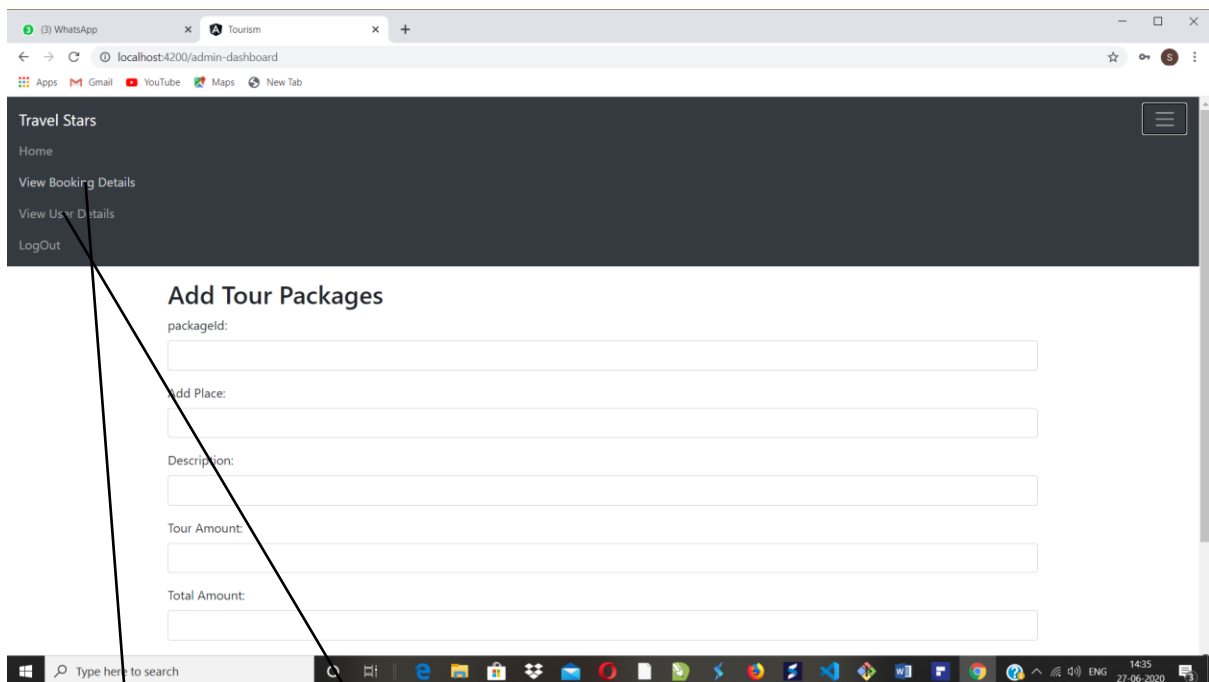

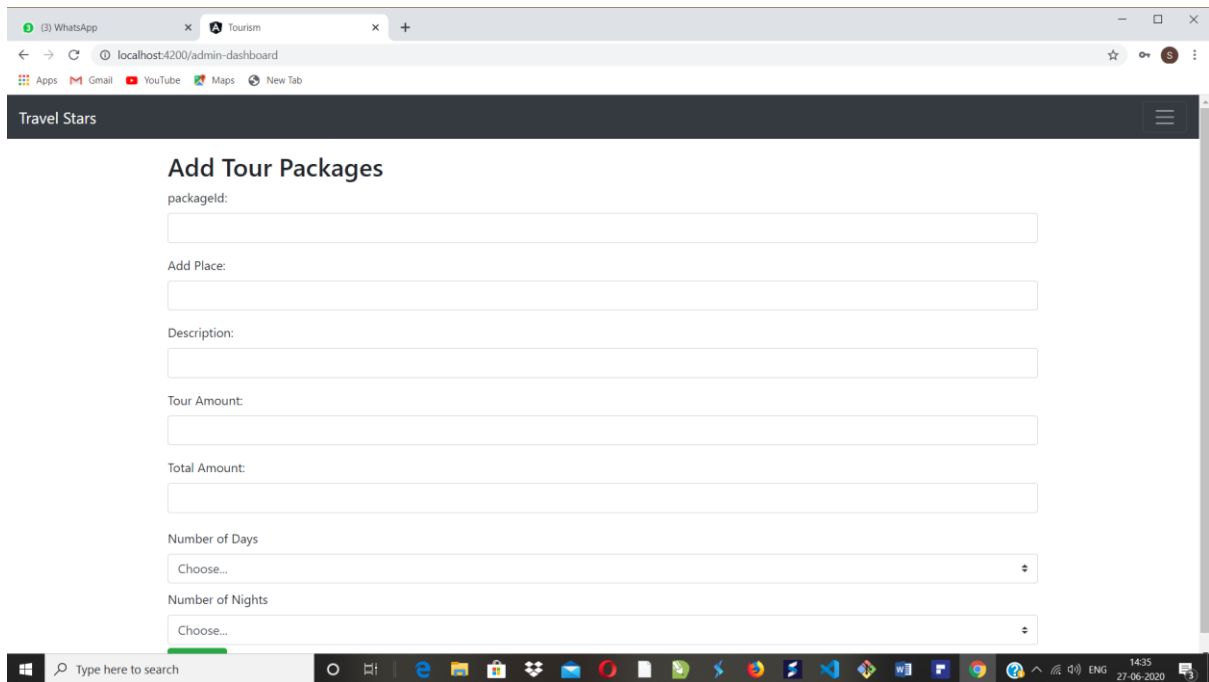

Submit

Terms and Condition Apply

When user submit the details go to database (mongo db)

Admin page:

From here we add the new package in the database

View users booking details

View no. of users login

Day 17 to Day 19

Finishing the project

Facing Problem During Development

I have faced some problems during the development of the “Tour Management” web-based application.

- **Requirement Gathering Phase:** It is very important step. If the requirements are not good, the project will fail. I was disappointed when I was collecting information and data then what information and data will be helpful or appropriate for this project.
- **During Design Phase:** At this time, I was confused about drawing flowchart because which flowchart will become better for this project.
- **Development Phase:** It is a critical part of the project. At this time, I have mistaken and at end of the statement.
- **Testing Phase:** It is a necessary part of the project. This part will help to test the whole project. At this time, I have to face some bugs for the project.

Conclusion

The tourism management system proves to be a strong system that has followed all the industrial standards. Normalization is applied to all the table sand and is found to be in 3NF. The functional dependencies are also listed. Working with such a system can enable the user to get any information with low-performance costs and increased throughput. As the database is created with good design, the system can comply with any demand in the future. The most widely used complex queries are also stated above. Also, the relational algebraic translation proves that the database is designed properly.
